

Ruby Code Documentation

Overview

This document outlines the implementation of a simple Ruby script for string manipulation.

Main Components

1. **Main Script**:

- A Ruby method that reverses a string.

2. **Functions**:

- `reverse_string()`: Takes a string as an argument and returns it reversed.
- `helper_function()`: Modifies the string further by changing its case.

Code Walkthrough

```
```ruby
```

```
def reverse_string(str)
```

```
 helper_function(str.reverse)
```

```
end
```

```
def helper_function(str)
```

```
 str.upcase
```

```
end
```

```
puts reverse_string("hello")
```

```
...
```

The script reverses a string and converts it to uppercase.
